

As part of the Tarea Ordenamiento (Ordinance Task), a telematic seminar was held this Wednesday, March 3, where the process to reach the different productive forms of Holguin province was oriented, with the supreme objective of raising productivity and efficiency, that in the end will result in the improvement of the socioeconomic life of food producers and their families.

In this videoconference were analyzed the preparations for the seminars and workshops that have to deepen in the particularities of each territory and the effort to overcome with the use of the internal strengths of each productive form, in the presence of the member of the Provincial Party Bureau in charge of the food sector, Juan Domínguez Pérez, and Rigoberto Rivero Durán, official of the Provincial Government in charge of the branch.

A dissertation by Yorlenis Games Games, deputy director of the Branch School of Agriculture at its headquarters in Holguín province, on the steps to follow in this process served as a methodological preparation for the next seminars at municipal level and the grass-root workshops, that is to say, in all the production systems.

It was oriented to create work commissions, similar to the one created at the provincial level, to organize the work to be carried out, to work with the truth in hand so that the process fulfills the task of promoting the production forces of each unit, and where the participation of all those linked to the sector is achieved.

That is why it was insisted on studying the documentation well, calling all the parties involved in the process, where neither the union nor the Anap farmer association can be absent, as well as the heads of the companies in each municipality.

If a good diagnosis is made of each entity and the process is properly organized, the results will serve not only to boost the economic life of the units, but also, that these results will be used to outline actions and strategies, which will be part of the platform to be presented to the Ministry of Agriculture and the Cuban State.

This process is so important that it will serve as a postgraduate course for the delegates of Agriculture, whose assessment before the

University Academy will be scientifically rigorous.

For this reason, it was emphasized that university students will join the process, according to a resolution of the Minister of Higher Education.

Likewise, sample polygons must be created in cooperatives of each municipality to serve as teaching and promotion of the performance of each productive structure.

If the process is successful, the current economic situation of many cooperatives in the province will be reversed, said Vladimir Ricardo Estrada, delegate of Agriculture in the province.

This process is so important that it will be auditable, therefore, the indication to open a file, ratified Ricardo Estrada.

And for this, it is necessary to instruct them that the debate must be based on what each one can and must do to overcome the difficulties, that is why it was reminded that the State will not finance losses, that the units will have to request credits to the banks, before whom they assume the responsibility of payment.

The essence of the process is to bring to the producers the certainty that each structure has to grow, and to overcome the goals by its own effort, that its strength lies in how much can be done in pursuit of individual and collective welfare, so that in the end it will be a successful process, concluded Juan Domínguez Pérez, member of the Provincial Party Bureau in charge of the food sector.
